Application No.: 10/807,406 3 Docket No.: 449122070000

## **AMENDMENTS TO THE CLAIMS**

This listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently amended) A circuit arrangement, comprising:

a linear variable differential transformer as a displacement sensor-or force sensor;

a selection circuit which is connected to a primary coil of the transformer and which

provides an output current for triggering the primary coil;

an analysis circuit which is connected to secondary coils of the transformer and which

provides a measurement signal; and

a control circuit to trigger the selection circuit and the analysis circuit and to process the

measurement signal provided by the analysis circuit is connected to the primary coil to calculate

a temperature of the circuit arrangement, and is configured such that it determines the

temperature-dependent ohmic resistance of the primary coil and calculates the temperature and

corrects accordingly the measurement signal provided by the analysis circuit, the current having

a trapezoidal characteristic through the primary coil with equally high rising edge and falling

edge values, and the control circuit configured such that sampling values of a rectangular voltage

picked up on the primary coil and of a voltage proportional to the current through the primary

coil are taken at times at which the trapezoidal current has a constant characteristic.

2. (Previously presented) The circuit arrangement according to claim 1, wherein the control

circuit has an adding circuit with inputs connected to terminals at which a voltage proportional to

the resistance value of the primary coil or a reference voltage are provided.

3. (Previously presented) The circuit arrangement according to claim 2, wherein the

Application No.: 10/807,406 4 Docket No.: 449122070000

reference voltage is a voltage proportional to the current through the primary coil.

- 4. (Previously presented) The circuit arrangement according to claim 1, wherein sampling values are taken in a first and the second half of a period of the rectangular voltage picked up at the primary coil, and of the voltage proportional to the current through the primary coil, and in that difference values formed from the sampling values from the first half of the period and from the sampling values from the second half of the period are used as measurement values.
- 5. (Previously presented) The circuit arrangement according to claim 1, wherein output ports of the secondary coils are connected to a control circuit, which is configured such that a sum of output voltages present at the output ports is compared to a setpoint value, and the control circuit interoperates with the selection circuit such that rising edge and falling edge values of a triangular output current of the selection circuit are varied in a manner inversely proportional to deviation of sum of the output voltages from the setpoint value.
- 6. (Previously presented) The circuit arrangement according to claim 5, wherein the analysis circuit has two amplifier circuits, which are connected to one of the two secondary coils and amplify respective output signals, and the outputs of the amplifier circuits are connected to the control circuit.
- 7. (Previously presented) The circuit arrangement according to claim 6, wherein the selection circuit has a rectangular voltage generation circuit and an integration circuit triggered

Application No.: 10/807,406 5 Docket No.: 449122070000

by the rectangular voltage generation circuit.

8. (Previously presented) The circuit arrangement according to claim 7, wherein the rectangular voltage generation circuit is formed with a first resistor, having a first port connected to a third voltage source and a second port connected to the output of the rectangular voltage generation circuit, and with a second resistor, having a first port connected to a fourth voltage source and a second port connected via a switch controllable from the control circuit to the output of the rectangular voltage generation circuit, the voltages of the third and the fourth voltage source following a relationship

U3-Uref=Uref-U4

and Uref being a reference voltage.

- 9. (Previously presented) The circuit arrangement according to claim 8, wherein the third and the fourth voltage source are configured such that they are controllable and their voltages can be adjusted via the control circuit.
- 10. (Previously presented) The circuit arrangement according to claim 9, wherein the integration circuit is formed with an operational amplifier having an output coupled back to the inverting input via a capacitor, with a bi-directional Zener diode being switched in parallel to the capacitor.

Application No.: 10/807,406 6 Docket No.: 449122070000

11. (Previously presented) The circuit arrangement according to claim 10, wherein the analysis circuit is configured such that sampling values of the rectangular difference between the output voltages of the secondary coils picked up on the coils are taken in the first and second halves of the period, and the difference values formed from the sampling values from the first half of the period and from the sampling values from the second half of the period are output as the measurement signal.
